Lab 1

Alonzo Finch

Initializing R

When starting a new assignment or project in R, I recommend using R Markdown (file type .Rmd). R Markdown has some advantages over R script files (file type .R), such as running blocks of code, being able to see the output of your code chunks, including text in addition to R code in your file, and (most importantly) the ability to export your R output as an HTML or PDF document.

This is an R markdown file.

Below are three different examples of code chunks. Note that you can name chunks by including text after the r designation in the brackets. Ex. {r test}

The flags include after the comma tell markdown how to render the code chunk. The flag *include* determines whether the chunk and its output will be included in the render. *include = F* will not render either.

The flag *echo = F* will render the output but not the code chunk itself.

The flag *warning = F* will suppress any warnings that are included in the output.

```
# This is how you type comments in your R code. Comments don't produce an output but act as a note separating or explaining what's written.
```

The flags above are all set to false, which is done by using **F** or **FALSE**. They can be set equal using **T*** or **TRUE**.

Loading Packages

Below is a chunk of R code. This code chunk loads the packages we will be using for this lab. It is important to remember that to use a package in R, you must download the package to you system **and** load the package in R like below.

```
library(readr)
library(stringr)
library(ggplot2)
```

```
## Warning: package 'ggplot2' was built under R version 4.4.2
```

```
library(tidyverse)
```

```
## ── Attaching core tidyverse packages ────────────────── tidyverse 2.0.0 ──
## ✓ dplyr     1.1.4     ✓ purrr     1.0.2
## ✓ forcats   1.0.0     ✓ tibble    3.2.1
## ✓ lubridate 1.9.3     ✓ tidyr     1.3.1
## ── Conflicts ──────────────────────────────── tidyverse_conflicts() ──
## ✗ dplyr::filter() masks stats::filter()
## ✗ dplyr::lag()    masks stats::lag()
## ℹ Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to becom
e errors
```

```
library(tigris)
```

```
## Warning: package 'tigris' was built under R version 4.4.3
```

```
## To enable caching of data, set `options(tigris_use_cache = TRUE)`
## in your R script or .Rprofile.
```

```
#require(tigris) #represents an alternative method. Returns a warning instead of an error if a p
ackage is not installed
```

Loading Data

Below is a chunk demonstrating how to load data in R. The first line uses traditional R syntax to load the CDC PLACES dataset. R comes installed with several built in functions and features, one of which is the function **read.csv** (type ?read.csv in the console to learn more about the function). The other datasets are loaded using **read_csv** from the **readr** package. **readr** provides some nice options for reading and writing datasets that are useful for more complicated projects.

The chunk below also includes two equivalent versions of variable assignment. You can name a variable anything (as long as it doesn't start with a number) and assign values using **=** or **<-**. The lines below assign the output of the function to a variable. In R Markdown, all assigned variables appear in your *Environment* window.

```
places <- read.csv("data/cdc_places_dc.csv")
dp02 = read_csv("data/acs_dp02_data.csv", show_col_types = F)
```

```
## New names:
## • `` -> `...619`
```

```
dp03 = read_csv("data/acs_dp03_data.csv", show_col_types = F)
```

```
## New names:
## • `` -> `...551`
```

```
dp04 = read_csv("data/acs_dp04_data.csv", show_col_types = F)
```

```
## New names:
## • `` -> `...575`
```

```
dp05 = read_csv("data/acs_dp05_data.csv", show_col_types = F)
```

```
## New names:
## • `` -> `...379`
```

Exploratory Data Analysis

CDC PLACES

Once you have the dataset loaded, I like to first look at a small snippet of the data and get a sense of what information it contains. For this part I will be focusing on the CDC PLACES data. Below are three functions that are useful for this task. **head** allows you to look at the first few rows of a datatable. There is also a corresponding function **tail**. **colnames** gets a list of the column names of the dataset. **dim** gets the dimensions of the datatable, which lets us know how many rows and columns we have in our dataset.

```
head(places)
```

Y…	StateAbbr	StateDesc	CountyName	CountyFIPS	LocationName	D
<int>	<chr>	<chr>	<chr>	<int>	<dbl>	<d
1 2022	DC	District of Columbia	District of Columbia	11001	11001007202	Bl
2 2022	DC	District of Columbia	District of Columbia	11001	11001009505	Bl
3 2022	DC	District of Columbia	District of Columbia	11001	11001001600	Bl
4 2022	DC	District of Columbia	District of Columbia	11001	11001002202	Bl
5 2022	DC	District of Columbia	District of Columbia	11001	11001004704	Bl
6 2022	DC	District of Columbia	District of Columbia	11001	11001002002	Bl

6 rows | 1-8 of 25 columns

◀ ▬▬▬▬▬▬▬▬▬ ▶

```
colnames(places)
```

```
##  [1] "Year"                      "StateAbbr"
##  [3] "StateDesc"                 "CountyName"
##  [5] "CountyFIPS"                "LocationName"
##  [7] "DataSource"                "Category"
##  [9] "Measure"                   "Data_Value_Unit"
## [11] "Data_Value_Type"          "Data_Value"
## [13] "Data_Value_Footnote_Symbol" "Data_Value_Footnote"
## [15] "Low_Confidence_Limit"     "High_Confidence_Limit"
## [17] "TotalPopulation"          "TotalPop18plus"
## [19] "Geolocation"              "LocationID"
## [21] "CategoryID"               "MeasureId"
## [23] "DataValueTypeID"          "Short_Question_Text"
```

```
dim(places)
```

```
## [1] 8240    24
```

Another import part of data inspection is looking at the data type or class (e.g. string, double, integer, factor) of your columns. In the chunk below are two methods for getting the types. This is important because certain functions and methods only work on specific data types so if any are incorrect (like an integer being typed as a string), we would need to fix that problem.

```
# str(places) #commented out due to the output containing a lot of information
sapply(places, class)
```

```
##                        Year                    StateAbbr
##                   "integer"                  "character"
##                   StateDesc                   CountyName
##                 "character"                  "character"
##                  CountyFIPS                 LocationName
##                   "integer"                    "numeric"
##                  DataSource                     Category
##                 "character"                  "character"
##                     Measure              Data_Value_Unit
##                 "character"                  "character"
##             Data_Value_Type                   Data_Value
##                 "character"                    "numeric"
## Data_Value_Footnote_Symbol          Data_Value_Footnote
##                   "logical"                    "logical"
##        Low_Confidence_Limit        High_Confidence_Limit
##                   "numeric"                    "numeric"
##             TotalPopulation               TotalPop18plus
##                   "integer"                    "integer"
##                 Geolocation                   LocationID
##                 "character"                    "numeric"
##                  CategoryID                    MeasureId
##                 "character"                  "character"
##             DataValueTypeID          Short_Question_Text
##                 "character"                  "character"
```

Now that we've inspected our data, we can convert our datatable into a tibble. A tibble is a tidyverse version of a datatable which provides some useful features for data cleaning. Below is an example of a tidyverse data cleaning pipeline. We only want the variable names, their values, and the id of the census tract (often called FIPS code). We also want to pivot the data so the variables are each their own column and the census tracts are the rows.

The code chunk below performs both of these operations at once using the tidyverse syntax of pipelines. There are two different ways to indicate a pipeline. **%>%** and **|>** are both pipeline operators. Pipelines pass the object at the start (usually a tibble) to the rest of the functions as an argument automatically, saving us some typing and simplifying our code. Pipelines also allow us to call column names without the use of quotation marks, which is helpful for some applications.

```
places_tibble = as_tibble(places) |>
  group_by(Year, LocationName,LocationID) %>%
  select(c(Year, LocationName, LocationID, Data_Value, MeasureId, TotalPopulation, TotalPop18plu
s, Geolocation)) %>%
  pivot_wider(names_from = MeasureId, values_from = Data_Value)
```

Now that we have something cleaner, we can look at a summary of our data using the function **summary**. **summary** is a great function for getting quick summaries of all different types of R objects, from regression outputs to datatables.

```
summary(places_tibble)
```

```

ACS Data

We'll now do the same procedure above for the American Community Survey Data.

If you inspected the csv file (for instance in excel), you'd see that the first two rows are both column names. The actually descriptive column name is row 2, so we will use one of the features of **read_csv** from **readr** to skip the first row.

```
dp02 = read_csv("data/acs_dp02_data.csv", skip = 1, show_col_types = F)
```

```
## New names:
## • `` -> `...619`
```

```
dp03 = read_csv("data/acs_dp03_data.csv", skip = 1, show_col_types = F)
```

```
## New names:
## • `` -> `...551`
```

```
dp04 = read_csv("data/acs_dp04_data.csv", skip = 1, show_col_types = F)
```

```
## New names:
## • `` -> `...575`
```

```
dp05 = read_csv("data/acs_dp05_data.csv", skip = 1, show_col_types = F)
```

```
## New names:
## • `Estimate!!SEX AND AGE!!Total population!!18 years and over` ->
##   `Estimate!!SEX AND AGE!!Total population!!18 years and over...43`
## • `Margin of Error!!SEX AND AGE!!Total population!!18 years and over` ->
##   `Margin of Error!!SEX AND AGE!!Total population!!18 years and over...44`
## • `Estimate!!SEX AND AGE!!Total population!!65 years and over` ->
##   `Estimate!!SEX AND AGE!!Total population!!65 years and over...49`
## • `Margin of Error!!SEX AND AGE!!Total population!!65 years and over` ->
##   `Margin of Error!!SEX AND AGE!!Total population!!65 years and over...50`
## • `Estimate!!SEX AND AGE!!Total population!!18 years and over` ->

```
dp05_tibble = as_tibble(dp05) %>%
  select(!contains("Margin of Error!!")) %>%
  select(!contains("Percent!!")) %>%
  select(!contains("Percent Margin of Error!!")) %>%
  mutate(Geography = str_remove(Geography, "1400000US")) %>%
  select(!c("Geographic Area Name")) %>%
  rename(geoid = Geography) %>%
  mutate(geoid = as.numeric(geoid))
```

```
dp05 = dp05_tibble
```

Combining Data

Now that we've (mostly) cleaned our data, we can combine our datasets together. First we must decide which axis we want to join (or combine) our dataset across. For our purposes, we're doing a column join. Then, we need to define the type of join. More detail about the different types of joins is available through other sources, but an overview is that different types of joins have the potential to drop any unmatched columns. The code below performs a left join for simplicity. A left join drops any unmatched columns from the second datatable.

```
df = left_join(places, dp02, by = "geoid")
df = left_join(df, dp03, by = "geoid")
df = left_join(df, dp04, by = "geoid")
df = left_join(df, dp05, by = "geoid")
```

We can also add the census tract geometries for plotting later using the **tigris** package.

```
dc_tracts <- tracts(state = "DC", cb = TRUE, year = 2022) %>% mutate(GEOID = as.numeric(GEOID))
%>% select(c(AWATER, ALAND, GEOID, geometry)) %>% rename(geoid = "GEOID")
```

```
##    |                                                              |
|   0%  |                                                              |==
|   3%  |                                                              |====
|   6%  |                                                              |========
|  12%  |                                                              |========
====================                              |  42%  |
|======================================            |  59%  |
|=========================================================     |  83%  |
|============================================================   |  95%  |
|==============================================================| 100%
```

```
df = left_join(df, dc_tracts, by = "geoid")
```

The df object above is our final datatable containing all of the estimates for our measures of interest as well as geoids for the census tracts.

Plotting

This section will show you the initial code for plotting in tidyverse using its child package **ggplot2**. There is a comprehensive website for both tidyverse and ggplot2 online published by their maintainers, so check that out if you want more information on how both packages work.

For the code below, I'll first plot a histogram of the total population so we can see its overall distribution, then I'll plot and export a spatial- or geo-plot of the same variable to show you an example of how to export a plot. We will go over this more in later lab sessions as well.

```
ggplot(data = df) +
  geom_histogram(aes(x = TotalPopulation), bins = 35, fill = "goldenrod", col = NA) +
  labs(title = "Plot of Total Population", subtitle = "Histogram", x = "Population", y = "Coun
t")
```
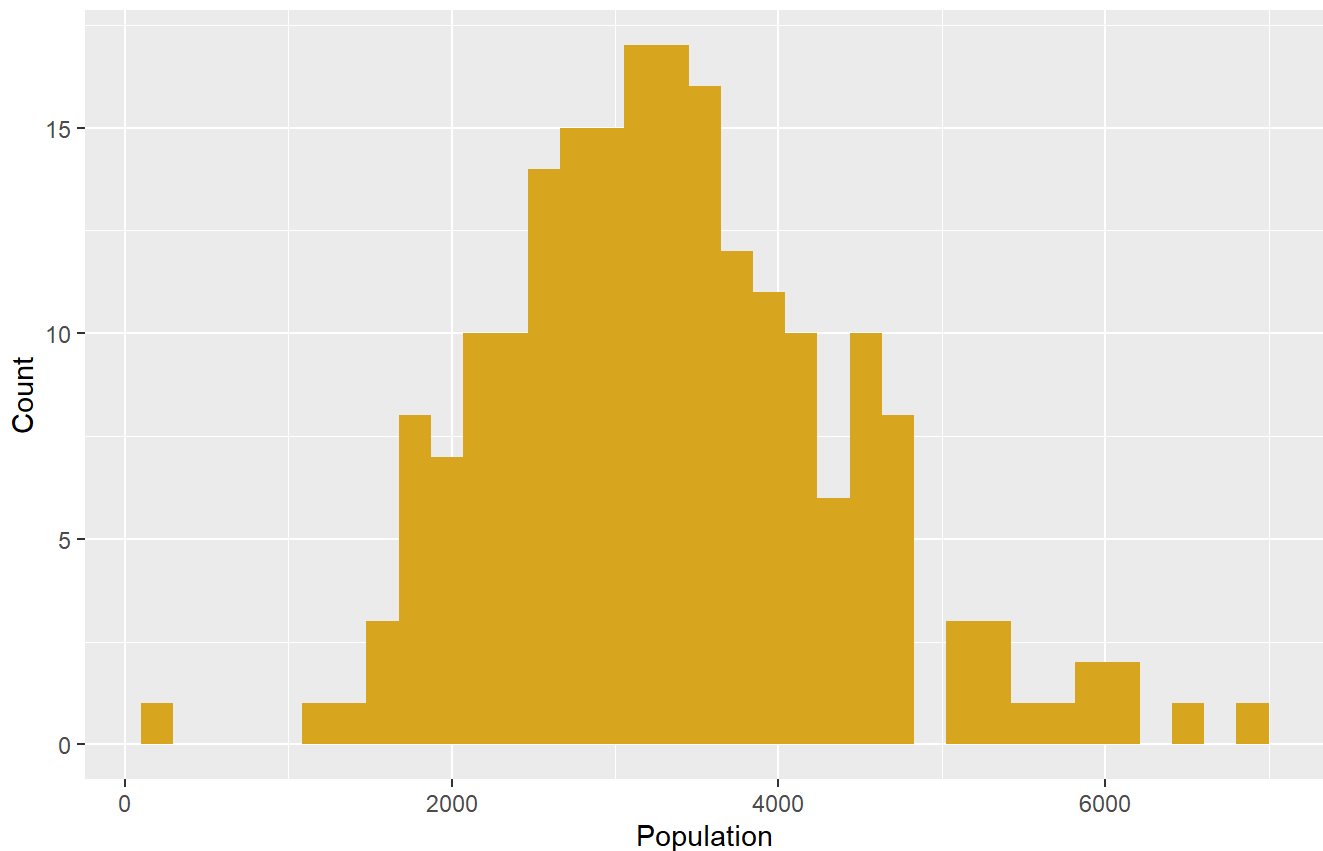

```
population_plot = ggplot(df, aes(geometry = geometry, fill = TotalPopulation)) +
  geom_sf(col = NA) +
  coord_sf() +
  scale_fill_viridis_c() +
  labs(title = "Total Population", subtitle = "Spatial Plot",
      xlab = "Longitude", ylab = "Latitude", fill = "Population") +
  theme(legend.position = "top", legend.title.position = "top", plot.margin = unit(c(0.05, 0.05,
0.05, 0.05), "cm"))

ggsave("population_plot.png", plot = population_plot)
```

```
## Saving 7 x 5 in image
```

The above chunk saves the spatial plot to the same folder that this markdown file is in. The file is titled "population_plot.png"
